FOREWORD

This specification covers work, materials and equipment required for protection and/or rehabilitation of concrete and masonry manholes, underground vaults and other wastewater structures by monolithic spray application of DuraLine, a high-build, 100% Solids high modulus epoxy coating system to eliminate infiltration, provide corrosion protection and enhance structural integrity. Procedures for surface preparation, cleaning, application and testing are described herein.

PART 1 - GENERAL

1.01 SECTION INCLUDES

A. Requirements for surface preparation, repairs and 100% Solids epoxy coating application to specified surfaces.

1.02 MEASUREMENT AND PAYMENT

A. Payment shall be based on a per vertical foot or square foot basis and includes all work required for surface cleaning, preparation, application and testing.

1.03 REFERENCES

A. ASTM D638 - Tensile Properties of Plastics.
C. ASTM D4541 - Pull-off Strength of Coatings Using a Portable Adhesion Tester.
D. ASTM D2584 - Volatile Matter Content.
E. ASTM D2240 – Shore D Hardness
F. ASTM C109 - Compressive Strength Hydraulic Cement Mortars.
G. ACI 506.2-77 - Specifications for Materials, Proportioning, and Application of Shotcrete.
H. ASTM C579 - Compressive Strength of Chemically Setting Silicate and Silica Chemical Resistant Mortars.
1.04 SUBMITTALS

A. The following items shall be submitted:

1. Technical data sheet on each product used, including ASTM test results indicating the product conforms to and is suitable for its intended use per these specifications.

2. Material Safety Data Sheets (MSDS) for each product used.

3. Project specific guidelines and recommendations.

4. Applicator Qualifications:
   a. Manufacturer certification that applicator has been trained and approved in the handling, mixing and application of the products to be used.
   b. Certification that the equipment to be used for applying the products has been manufactured or approved by the protective coating manufacturer and applicator personnel have been trained and certified for proper use of the equipment.
   c. Five (5) recent references of Applicator (projects similar size and scope) indicating successful application of high-build 100% Solids epoxy coating installations.
   d. Proof of any necessary federal, state or local permits or licenses necessary for the project.

5. Design details for any additional ancillary systems and equipment to be used in site and surface preparation, application and testing.

1.05 QUALITY ASSURANCE

A. Applicator shall initiate and enforce quality control procedures consistent with applicable ASTM, NACE and SSPC standards and the protective coating manufacturer's recommendations.

B. (OPTIONAL) A NACE Certified Coating Inspector shall be provided by Owner. The Inspector will observe surface preparation, application and material handling procedures to ensure adherence to the specifications.
1.06 DELIVERY, STORAGE, AND HANDLING

A. Materials are to be kept dry, protected from weather and stored under cover.

B. Protective coating materials are to be stored between 50 degrees fahrenheit and 90 degrees fahrenheit. Do not store near flame, heat or strong oxidants.

C. Protective coating materials are to be handled according to their material safety data sheets.

1.07 SITE CONDITIONS

A. Applicator shall conform with all local, state and federal regulations including those set forth by OSHA.

B. Method statements and design procedures are to be provided by Owner when confined space entry, flow diversion or bypass is necessary in order for Applicator to perform the specified work.

1.08 WARRANTY

A. Applicator shall warrant all work against defects in materials and workmanship for a period of one (1) year, unless otherwise noted, from the date of final acceptance of the project. Applicator shall, within a reasonable time after receipt of written notice thereof, repair defects in materials or workmanship which may develop during said one (1) year period, and any damage to other work caused by such defects or the repairing of same, at his own expense and without cost to the Owner.

PART 2 - PRODUCTS

2.01 EXISTING PRODUCTS

A. Standard Portland cement or new concrete (not quick setting high strength cement) must be well cured prior to application of the protective coating. Generally, 28 days is adequate cure time for standard Portland. If earlier application is desired, compressive or tensile strength of the concrete can be tested to determine if acceptable cure has occurred. (Note: Bond strength of the coating to the concrete surface is generally limited to the tensile strength of the concrete itself. Engineer may require Elcometer pull tests to determine suitability of concrete for coating)

B. Remove existing coatings prior to application of the new protective coating. Applicator is to maintain strict adherence to applicable NACE and SSPC recommendations with regard to proper surface preparation and compatibility with existing coatings.
2.02 MANUFACTURER:

DuraSeal, LLC
65 W Fifth Street
Crossville, Tennessee 38555
Phone: 512-944-0895
E-MAIL: Sales@DuraSealUSA.com
Website: www.DuraSealUSA.com

2.03 REPAIR MATERIALS

A. **DuraSeal RM** shall be used to fill voids, structurally reinforce and/or rebuild surfaces, etc. as determined necessary by the engineer and protective coating applicator. All other repair materials must be compatible with the specified epoxy coating and shall be applied in accordance with their manufacturer’s recommendations. Such repair mortars should not be used unless their manufacturer provides information as to its suitability for topcoating with an epoxy coating. Project specific submittals should be provided including application, cure time and surface preparation procedures which permit optimum bond strength with the epoxy coating.

B. The following products or approved equal may be accepted and approved as compatible repair basecoat material for epoxy topcoating for use within the specifications:

C. **DuraSeal PM** is a single component, fiber reinforced, shrinkage compensated, high strength repair mortar, designed specifically for the rehabilitation of both brick and concrete wastewater structures.

D. **DuraSeal CA** is a single component, pure fused calcium aluminate cement, fiber reinforced, shrinkage compensated, high strength repair mortar, designed specifically for superior corrosion protection of both brick and concrete wastewater structures.

2.04 PROTECTIVE COATING MATERIAL

A. **DuraLine** is a high build, two component, 100% solids, moisture tolerant epoxy coating designed specifically for outstanding corrosion protection of both brick and concrete wastewater structures.

2.05 PROTECTIVE COATING APPLICATION EQUIPMENT

A. Manufacturer approved spray application equipment shall be used in the application of the specified protective coating system.

2.06 REPAIR MORTAR APPLICATION EQUIPMENT

A. Spray applied repair mortars shall be applied with manufacturer approved application equipment.

B. Hand application.

PART 3 - EXECUTION

3.01 ACCEPTABLE APPLICATORS

A. Protective coating system must be applied by a certified applicator of the protective coating manufacturer and according to manufacturer specifications guidelines.

3.02 EXAMINATION

A. All structures to be coated shall be made accessible to Applicator.

B. Appropriate actions shall be taken to comply with local, state and federal regulatory and other applicable agencies with regard to environment, health and safety.

C. Any active flows shall be dammed, plugged or diverted as required to ensure that the liquid flow is maintained below the surfaces to be coated. Flows should be totally plugged and/or diverted when coating the invert. All extraneous flows into the manhole or vaults at or above the area coated shall be plugged and/or diverted until the epoxy has set hard to the touch. As an option, hot air may be added to the manhole to accelerate set time of the coating.

D. Installation of the protective coating shall not commence until the substrate has properly cured in accordance with these specifications.

E. Temperature of the surface to be coated should be maintained between 50 degrees fahrenheit and 120 degrees fahrenheit during application. Prior to and during application, care should be taken to avoid exposure of direct sunlight or other intense heat source to the structure being coated. Where varying surface temperatures do exist, care should be taken to apply the coating when the temperature is falling versus rising (ie. late afternoon into evening vs. morning into afternoon).
3.03 SURFACE PREPARATION

A. Applicator shall inspect all surfaces specified to receive a protective coating prior to surface preparation. Applicator shall notify Owner of any noticeable disparity in the surfaces which may interfere with the proper preparation or application of the repair mortar and protective coating.

B. Place invert boards to cover and protect against debris and material from entering the sewer system.

C. (at owners option) All ladder rungs should be removed flush to the surface and patched with approved repair mortar.

D. All contaminants including: oils, grease, incompatible existing coatings, waxes, form release, curing compounds, efflorescence, sealers, salts, or other contaminants or conditions shall be removed or remedied.

E. All concrete or mortar that is not sound or has been damaged by chemical exposure shall be removed to a sound concrete surface or replaced.

F. Surface preparation method(s) should be based upon the conditions of the substrate, service environment and the requirements of the epoxy protective coating to be applied.

G. Surfaces to receive protective coating shall be cleaned and abraded to produce a sound surface with adequate profile and porosity to provide a strong bond between the protective coating and the substrate. Generally, this can be achieved with a high pressure water cleaning using equipment capable of 5,000 psi at 4 gpm. Other methods such as high pressure water jetting, abrasive blasting, shotblasting, grinding, scarifying or acid etching may also be used. Detergent water cleaning and hot water blasting may be necessary to remove oils, grease or other hydrocarbon residues from the substrate. Whichever method(s) are used, they shall be performed in a manner that provides a uniform, sound clean neutralized surface with a minimum surface profile of 3.0 mils and that is not excessively damaged. Follow surface cleaning procedures with application of chlorinated water for a minimum fifteen minute dwell time to remove any remaining biologicals and neutralize the surface. Then thoroughly flush the surface with fresh water. Test the wet surface ph with universal ph indicator paper with a range of ph 0–10, or other suitable test instrument. Universal ph indicator paper, or other ph testing equipment may be obtained from any national scientific supply company such as; Van Waters and Rodgers (800) 923-5000 or J.T. Baker (800) 582-2537.

H. Acceptable surface ph for epoxy application shall be between 6–9. If ph is indicated outside this range, repeated applications of chlorinated water and fresh water shall continue until the surface is within the acceptable ph range.

I. Infiltration shall be stopped by using DuraSeal Plug or other material such as chemical grout which is compatible with the repair mortar and is suitable for topcoating with the specified epoxy protective coating.

J. All surfaces should be inspected by the Inspector during and after preparation and before the repair material is applied.
3.04 APPLICATION OF REPAIR MATERIALS

A. Areas where structural steel has been exposed or removed shall be repaired in accordance with the Project Engineer's recommendations. Metal surfaces shall be prepared to NACE No. 2 “Near White Blast Cleaning” and immediately coated with protective epoxy coating.

B. Repair materials shall be hand trowel or spray applied utilizing approved application equipment. The material thickness shall be specified by the Project Engineer according to Owner’s requirements and manufacturer's recommendations.

C. Cementitious repair materials shall be troweled to provide a smooth surface with an average profile of 3.0 mils equivalent to coarse sandpaper to optimally receive the protective coating. No bug holes or honeycomb surfaces should remain after the final trowel procedure of the repair mortar.

D. The repair materials shall be cured according to manufacturer recommendations. Curing compounds should not be used unless approved for compatibility with the specified protective coating.

E. Application of the repair materials, if not performed by the coating certified applicator, should be inspected by the protective coating certified applicator to ensure proper finishing for suitability to receive the specified coating.

F. After abrasive blast and infiltration control is performed, all surfaces shall be inspected for remaining laitance prior to protective coating application. Any evidence of remaining contamination or laitance shall be removed by additional abrasive blast, shotblast or other approved method. If repair materials are used, refer to these specifications for surface preparation. Areas to be coated must also be prepared in accordance with these specifications after receiving a cementitious repair mortar and prior to application of the epoxy coating.

G. All surfaces must be inspected during and after preparation and before the protective coating is applied.

3.05 APPLICATION OF PRIMER - DuraLine MP

A. DuraLine MP is a moisture tolerant epoxy primer designed specifically to improve the surface bonding characteristics and ultimate adhesion of both DuraFlex and DuraLine.

B. Mechanically mix resin, then add hardener and mix with an explosion proof drill for approximately one minute. Apply at 5-8 mils using a brush or short nap roller. Apply to a clean dry to damp surface, free of any standing water droplets.

</tr>
</tbody>
</table>

Times may be longer at greater thicknesses.
CAUTION: DuraLine MP resin is combustible. Keep away from all sources of ignition during mixing, application and cure. DuraLine MP hardener is corrosive and can cause eye and skin irritation as well as allergic reactions. See technical data sheet for additional cautions.

3.06 APPLICATION OF PROTECTIVE COATING

A. Application procedures shall conform to the recommendations of the protective coating manufacturer, including material handling, mixing, environmental controls during application, safety, and application equipment.

B. The application equipment shall be specifically designed to accurately ratio and apply the specified protective coating material and shall be regularly maintained and in proper working order.

C. The protective coating material must be applied by a certified applicator of the protective coating manufacturer.

D. Specified surfaces shall be coated by hand trowel, brush or spray application of a moisture tolerant, 100% solids, epoxy protective coating as further described herein. Application shall be a minimum wet film thickness of 60-125 mils. In cases where the project specifications list a thickness greater than 60-125 mils the project specifications will take precedence.

E. Airless spray application equipment approved by the coating manufacturer shall be used to apply the protective coating.

<td>8 HOURS</td>
<td>20-24 HOURS</td>
</tr>
<tr>
<td>50 F</td>
<td>24 HOURS</td>
<td>36-48 HOURS</td>
</tr>
</tbody>
</table>

CAUTION: DuraLine resin is combustible. Keep away from all sources of ignition during mixing, application and cure. DuraLine hardener is corrosive and can cause eye and skin irritation as well as allergic reactions. See technical data sheet for additional cautions.

F. If necessary, subsequent topcoating or additional coats of the protective coating should occur as soon as the basecoat becomes tack free, ideally within 12 hours but no later than the recoat window for the specified products. Additional surface preparation procedures will be required if this recoat window is exceeded.

G. Sloped surfaces of the floor may be made non-skid by broadcasting aluminum oxide or silica sand into the surface prior to gelation.

H. (Optional) Depending on flow levels and how long flow can be stopped, inverts may be lined with an approved 100% solids epoxy coating material.
A. During application a wet film thickness gage, such as those available through Paul N. Gardner Company, Inc. meeting ASTM D4414 - Standard Practice for Measurement of Wet Film Thickness of Organic Coatings by Notched Gages, shall be used to ensure a monolithic coating and uniform thickness during application.

B. (Optional – Note that this procedure is sometimes difficult or impossible to perform in tight manhole or vault structures) After the protective coating has set hard to the touch it shall be inspected with high-voltage holiday detection equipment. Surface shall first be dried, an induced holiday shall then be made on to the coated concrete surface and shall serve to determine the minimum/maximum voltage to be used to test the coating for holidays at that particular area. The spark tester shall be initially set at 100 volts per 1 mil (25 microns) of film thickness applied but may be adjusted as necessary to detect the induced holiday (refer to NACE RPO188-99). All detected holidays shall be marked and repaired by abrading the coating surface with grit disk paper or other abrasive method. After abrading and cleaning, additional protective coating material can be hand applied to the repair area. All touch-up/repair procedures shall follow the protective coating manufacturer's recommendations.

C. Measurement of bond strength of the protective coating to the substrate can be measured in accordance with ASTM D4541, by self alignment adhesion tester type IV. Any areas detected to have inadequate bond strength (less than 200 psi) shall be evaluated by the project engineer. Further bond tests may be performed in that area to determine the extent of potentially deficient bonded area and repairs shall be made by Applicator in strict accordance with manufacturer's recommendations.

D. Manhole Testing - Type A: Manholes lined in their entirety may be vacuum tested after materials have fully cured. All pipes entering the manhole should be plugged, taking care to securely restrain the plugs from being drawn into the manhole. The test head shall be placed and the seal inflated in accordance with the manufacturer's recommendations. A vacuum pump of ten (10) inches of mercury shall be drawn and the vacuum pump shut off. With the valves closed, the time shall be measured for the vacuum to drop to nine (9) inches. Following are minimum allowable test times for manhole acceptance at the specified vacuum drop:

<table>
<thead>
<tr>
<th>DEPTH (FEET)</th>
<th>48&quot; diameter</th>
<th>60&quot; diameter</th>
<th>72&quot; diameter</th>

</tr>
</tbody>
</table>

Add for 2 ft. more depth: 5  6  8

Note: These numbers have been taken from ASTM C 1244-93 (reapproved 2000).
If the manhole fails the initial test, repairs and adjustments necessary due to extenuating circumstances (ie. pipe joint, liner, plug sealing) should be made. Retesting shall proceed until a satisfactory test is obtained.

Manhole Testing - Type B: Manholes lined in their entirety (including invert) may be subjected to an exfiltration test. Incoming and outgoing sewer and service lines shall be plugged, the plugs restrained and the manhole filled with water to the top of the manhole frame. A soaking period of up to 1 hour will be allowed if bypassing of the sewage is not required or has been provided for. At the end of this optional soaking period, the manhole shall be refilled with water and the test begun. If the water loss exceeds that shown in the following table, the manhole will have failed the test. Repairs and adjustments necessary due to extenuating circumstances (ie. pipe joint, liner, plug sealing) should be made. Retesting shall proceed until a satisfactory test is obtained. Maximum Allowable Loss is determined assuming a standard 4 foot diameter manhole.

<table>
<thead>
<tr>

<td>1/8&quot; per foot of depth in 5 minutes</td>
</tr>
</tbody>
</table>

E. A final visual inspection shall be made by the Inspector and manufacturer's representative. Any deficiencies in the finished coating shall be marked and repaired according to the procedures set forth herein by Applicator.

F. The municipal sewer system may be put back into non-severe operational service as soon as the final inspection has taken place. However, for severe corrosion duty such as high concentrations of acids, bases or solvents, 3 to 7 days and/or force cure by heat induction to the coated surfaces may be necessary prior to returning to service. Consult coating manufacturer for further details.
